Doctor's Feedback: Based on your medical inputs, your cardiovascular risk prediction score is low at 0.075. This indicates a relatively low risk of developing cardiovascular disease. However, it is important to continue maintaining a healthy lifestyle to further reduce your risk. I recommend that you continue monitoring your blood pressure, cholesterol, and glucose levels regularly. It is also beneficial to maintain a healthy diet, engage in regular physical activity, and avoid smoking and excessive alcohol consumption. Additionally, consider scheduling regular check-ups with your healthcare provider to assess your cardiovascular health and discuss any concerns or questions you may have. Overall, your current lifestyle choices have contributed to a low cardiovascular risk prediction score, but it is important to continue these healthy habits to further reduce your risk of heart disease in the future.
